Complete One-Loop Renormalization of the Higgs-Electroweak Chiral Lagrangian

Abstract

Employing background-field method and super-heat-kernel expansion, we compute the complete one-loop renormalization of the electroweak chiral Lagrangian with a light Higgs boson. Earlier results from purely scalar fluctuations are confirmed as a special case. We also recover the one-loop renormalization of the conventional Standard Model in the appropriate limit.

I: ...of the electroweak chiral Lagrangian with a light Higgs.

The EWCh$\mathcal{L}$ is Chiral Perturbation Theory applied to Higgs physics.

Ingredients:

- Particles: all SM particles, but we do not assume a relation between the GB and the Higgs
- Symmetries: $SU(3)_C \times SU(2)_L \times U(1)_Y \to SU(3)_C \times U(1)_{em}$, B, L
  at LO: flavor and custodial symmetry
- Power counting: in terms of chiral dimensions (generalized momenta)

$$2L + 2 = [\text{couplings}]_\chi + [\text{derivatives}]_\chi + [\text{fields}]_\chi$$

$$[\text{bosons}]_\chi = 0,$$
$$[\text{fermion bilinears}]_\chi = [\text{derivatives}]_\chi = [\text{weak couplings}]_\chi = 1$$

Properties:

- It has generalized Higgs-couplings compared to the SM.
  $\Rightarrow$ related to the κ-formalism at LO.
- There is a hierarchy to the operators that modify the EWPD.
- It captures the low-energy effects of strongly-coupled new physics.
- It is non-renormalizable at LO.

Complete One-Loop Renormalization of the Higgs-Electroweak Chiral Lagrangian

Abstract

Employing background-field method and super-heat-kernel expansion [2], we compute the complete one-loop renormalization [3] of the electroweak chiral Lagrangian [1] with a light Higgs boson. Earlier results from purely scalar fluctuations are confirmed as a special case. We also recover the one-loop renormalization of the conventional Standard Model in the appropriate limit.

The Background Field Method separates (classical) background fields from (quantum) fluctuating fields. It ensures that the computation is (background) gauge invariant at all steps.

The Super-Heat-Kernel Expansion gives a universal Master-Formula: Extracting the UV-divergencies is now reduced to matrix multiplication and tracing.

Summary

I introduced the electroweak chiral Lagrangian, an effective field theory with generalized Higgs couplings.

The Background Field Method separates (classical) background fields from (quantum) fluctuating fields. It ensures that the computation is (background) gauge invariant at all steps.

The Super-Heat-Kernel Expansion gives a universal Master-Formula: Extracting the UV-divergencies is now reduced to matrix multiplication and tracing.

The result is consistent with the operator basis and confirms the power counting. It reproduces the Scalar divergencies and the SM-β-functions in the appropriate limits.
